GDAC Tools

GDAC Compliance and Fraud (NC FACTS)

NC FACTS, North Carolina Financial Accountability and Compliance Technology System, provides agencies with the ability to utilize integrated GDAC data, to generate alerts associated with program related fraud, compliance and/or improper payment. Based upon business requirements and analytic models, the alerts are prioritized to assist business owners in the management of alert investigation and adjudication.   For each alert generated, users are provided with a complete set information on which they can conduct their investigation. This eliminates a need for an investigator to jump from system to system to gather information for decision making. During the investigation of an alert, business owners are provided work space to capture notes and to manage work flow during the investigative process.

GDAC Reporting and Analytics

A variety of SAS tool are available to business owners who participate in the GDAC environment. These reporting tools provide the ability to leverage standard, system-generated reports and ad hoc reports. Advanced tools are also available to users to generate Business Intelligence Dashboards, and Visual Analytics.   The reporting and analytics capability for the GDAC shares the same technical environment as the NC FACTS fraud and compliance alerting solutions. This common technical infrastructure and data repository provides access to all integrated data as allowed by data governance agreements to support agency program analytics, metrics, predictive analysis and executive dashboards.

User Administration (NCSEAT)

NCSEAT supports the integration of the State's identity management tool, NCID, for user authentication. Every web-based GDAC solution leverages the NCSEAT enterprise solution for consistent authentication and support of application security requirements.
